## Transportation Study

# Southfort Area Structure Plan 

In the City of Fort Saskatchewan

August 2015

Prepared for:

FORT SASKATCHE Lit

## CORPORATE AUTHORIZATION

This report entitled Southfort Transportation Study was prepared by Al-Terra Engineering Ltd., under authorization and exclusive use of the City of Fort Saskatchewan.

The designs and recommendations put forward reflect Al-Terra's best judgment with the information available. Any use of this information in a manner not intended or with the knowledge that situations have changed shall not be the responsibility of Al-Terra Engineering Ltd.

## EXECUTIVE SUMMARY

The City of Fort Saskatchewan retained Al-Terra Engineering to complete the Southfort Transportation Study, a supplementary document to the 2013 Southfort Area Structure Plan (ASP). This study includes an implementation plan for expansion and improvement of the roadway network in the Southfort development area within a mulit-modal context to support new and existing development.

The Southfort ASP is located in the southeast corner of the City of Fort Saskatchewan, bounded on the west and north by Highway 21 and Highway 15, and on the south and east by the city boundary. The ASP plans for a population of between 18,300 and 21,000 people in a variety of housing types units, multiple commercial sites, school sites, a community centre, a hospital, a correctional institution, and a variety of parks and open spaces.

The Southfort Transportation Study's objectives were to identify projected traffic impacts along the road network adjacent to and within the Southfort area and to identify roadway standards, intersection geometry, and traffic control to accommodate the projected traffic volumes at acceptable levels of service. The methodology included:

- Reviewing the Southfort ASP land use assumptions
- Reviewing the proposed road network including road alignments, classification, and cross-sections
- Reviewing and confirming background traffic volumes
- Projecting traffic on the proposed roadway network generated by the Southfort area based on trip generation, trip distribution, mode spilt, and trip assignment assumptions
- Evaluating intersection treatments (traffic control and intersection geometry) throughout the development and the external intersection connections to Highway 21, Strathcona County, and other areas of Fort Saskatchewan
- Reviewing pedestrian and bicycle routes to and through the Southfort area
- Reviewing transit opportunities in the community

Existing external arterial roadways include Highway 21 and Highway 15. Internal arterial roadways include Southfort Drive/86 Avenue, 94 Street, and connections between Highway 21 and Southfort Drive on Southridge Blvd, Southfort Blvd, and 84 Street. There are a number of collector roads identified within the Southfort ASP. Some areas within the Southfort ASP have been developed for over ten years, so some of the roadways are already constructed to a first stage or ultimate cross-section.

Existing traffic volumes were available from counts completed in 2013. Additional traffic volumes from growth in the Southfort ASP were developed based on the ASP land use concept and trip generation rates developed by the Institute of Transportation Engineers (ITE) and studies completed locally in the City of Edmonton. Low, medium, and high density residential; school; and three commercial land use types were used to generate expected trips. The trips were distributed and assigned to the network using a combination of existing splits and data obtained from Alberta Transportation's Edmonton Regional Traffic Model (which includes Fort Saskatchewan). Two scenarios were reviewed - one at $50 \%$ development of the Southfort area, and one with full development of the Southfort Area.

Major intersections were analyzed using Synchro Studio 9 utilizing the Highway Capacity Manual (HCM) methodology. Recommendations were made for additional through lanes, turn lanes, signalization, and/or roundabouts where required.

Arterial and collector roadway corridors were reviewed with respect to projected daily traffic volumes; some roads identified in the ASP as arterial roads are recommended to be reduced to collector status upon this analysis. Some of these collector roads do not require on-street parking, therefore a revised multi-modal roadway cross-section is recommended to provide separate space for pedestrians, cyclists, and drivers. A number of roundabouts are recommended along the collector road corridor to provide traffic calming and consistent intersection operations.

Final recommendations from the Southfort Transportation Study include:

- Highway 21 and Highway 15 adjacent to the study area will require 6 basic lanes within the $50 \%$ development horizon.
- An additional access to Highway 21, south of the Southfort ASP area, will be required at full development.
- Southfort Drive will require four lanes from Southfort Blvd. to 94 Street within the 50\% development horizon.
- Southfort Drive could be reclassified as a collector road south of Southfort Blvd.
- Southridge Drive east of Southfort Drive and 94 Street south of Sienna Blvd could be reclassified as collector roads, and provide multi-modal road corridors with bicycle lanes.
- Five additional signalized intersections are identified along Southfort Drive, Southridge Blvd, and 94 Street.
- Two intersections at the south end of Southfort Drive are identified as potential roundabout locations due to the moderate traffic volumes that do not require signals.
- Four roundabouts are proposed along the Southridge Blvd/94 Street extensions.

Exhibit ES. 1 illustrates the road network recommendations at full buildout of the Southfort ASP.

### 1.0 Introduction

In the spring of 2014, Al-Terra Engineering was commissioned by the City of Fort Saskatchewan to undertake the Southfort Transportation Study, a supplementary document to the 2013 Southfort Area Structure Plan. The study was to include an implementation plan for expansion and improvement of the roadway network in the Southfort development area within a multi-modal context.

### 1.1 Background

The Southfort Area Structure Plan (ASP) was approved by the City in June 2013 - Bylaw C7-13. The document provides land uses, access and servicing, and policy direction for an area on the southeast side of Fort Saskatchewan that will ultimately accommodate a population of 18,300-21,000.

The ASP is a guide for the location, intensity and character of land uses. The Southfort ASP land uses include:

- A variety of residential housing types and densities with 7,300-8,400 dwelling units
- Commercial sites located between Highway 21 and Southfort Drive
- School sites to potentially accommodate 5 schools
- Community Hospital - completed in 2012
- DOW Centennial Centre, a major recreational/cultural facility - completed in 2003
- The Fort Saskatchewan Correctional facility
- The future site of the Royal Canadian Mounted Police detachment
- Open spaces with interconnecting walkways and City's trail systems
- General water, sanitary and storm servicing facilities for the area

### 1.2 Study Objectives

The objective of this study was to identify the projected traffic impacts along the roadway network adjacent to and within the Southfort area and to identify required roadway standards, intersection geometry, and traffic control to accommodate the projected traffic volumes at acceptable levels of service.

### 1.3 Study Methodology

The Southfort Transportation Study methodology included the following components:

- A review of the Southfort ASP land use assumptions
- Examination of the proposed road network including road alignments, classification, and crosssections
- Review and confirmation of background traffic volumes associated with the study area
- Projecting traffic on the proposed roadway network that is anticipated to be generated by the Southfort area based on trip generation, trip distribution, mode spilt, and trip assignment assumptions
- Evaluating intersection treatments (traffic control and intersection geometry) throughout the development and the external intersection connections to Highway 21, Strathcona County, and other areas of Fort Saskatchewan
- Review of pedestrian and bicycle routes to and through the Southfort area
- Review of transit opportunities in the community

### 2.0 Site Context

### 2.1 Site Location

The Southfort ASP includes approximately 700 hectares (1700 accres) of land located in the southeast part of the City of Fort Saskatchewan. The area is bounded by Highway $21 /$ Highway 15 to the northwest, $101^{\text {st }}$ Street to the northeast and by the east and south city boundary to the east and south, respectively. Exhibit 2.1 - Key Map illustrates the location of Southfort within the City of Fort Saskatchewan and surrounding municipalities.

### 2.2 Existing Area Characteristics

### 2.2.1 Existing Land Uses

The existing Southfort area is partially developed and the existing developments are mainly located in the west and north. The area is continuously developing and progressing to the south and east.

Initial development of the Southfort ASP was concentrated east of Highway 21/Highway 15 and on the north side of Southfort Drive, which included commercial land uses. Residential developments followed along Southfort Drive and $94^{\text {th }}$ Street. The majority of the residential areas east of Southfort Drive are low density developments.

The completed institutional developments include a community hospital, correctional institution and the Dow Centennial Recreation Centre. They are located in the northeast part of the Southfort area, west of Highway 21.

### 2.2.2 Existing Road Network

Existing major roadways in the area include Highway 21 and Highway 15, which are classified as expressways. The basic cross-section of these roadways is a divided four lane rural roadway with widening through major intersections to accommodate turning movements. Five major signalized intersections provide primary access to Southfort and to developed areas to the west. In addition, there are right-in/rightout intersections with auxiliary lanes, which provide additional access to Southfort commercial developments.

Internal roadways in Southfort include:

- Southfort Drive/86 Avenue, which is designated as an arterial roadway between Southridge Boulevard and 101 Street, runs parallel to Highway 21 and Highway 15. In the longer term Southfort Drive is planned as a conventional four lane divided roadway south of 94 Street. Currently Southfort Drive is completed to the ultimate four lane section for only a short distance south of 94 Street. Other sections are constructed with two initial lanes and some widening at intersections. The southern portion of Southfort Drive is yet to be completed to provide continuation to Southridge Boulevard. 86 Avenue, north of 94 Street, is adjacent to the hospital and correctional institute to the east and commercial development to west. It is constructed as 4 lane undivided roadway.
- 94 Street is a southeast extension of Highway 15, southeast of the Highway 21/Highway 15 intersection. The roadway is constructed as a four lane cross-section which transitions to two lanes east of Southfort Drive. Currently 94 Street extends south and terminates at Sienna Boulevard. Eventually, 94 Street will extend south and west to connect to Southridge Boulevard when

development progresses futher south. 94 Street provides access to the Sienna neighborhood currently under construction.
- Southridge Boulevard, Southfort Boulevard, and 84 Street provide arterial standard road connections between Highway 21 and Southfort Drive, and are constructed as either 4 or 2 lane cross-sections.
- 101 Street, at the north boundary of Southfort ASP, is constructed to an urban arterial standard with a 4 lane divided cross-section. East of 86 Avenue, the roadway transitions to 2 lane rural cross-section.
- Collector roadways which include Allard Way and Greenfield Way provide access to developed Southfort Neighborhoods east of Southfort Drive.

### 2.2.3 Existing Traffic

Existing (2013) intersection traffic counts at the Highway 21/Highway 15 intersection, and link volumes at some internal Southfort locations were provided by the City. In addition, permanent counter information was used to determine the peak hour relationship to daily traffic volumes on the road network.

No intersection traffic information was provided within the existing internal roadways, but it was estimated based on methodology used for new developments and then iteratively balanced between available link volumes

Estimated traffic volumes representing year 2013 conditions, which include the road network and development that existed at that time, are illustrated in Appendix A. 2013 is considered the base year for future traffic estimates throughout the study.

### 3.0 Development and Traffic Characteristics

### 3.1 Proposed Development

The Southfort ASP is bounded by Highway 21 and Highway 15 to the west, 101 Street to the north, Range Road 225 (east city boundary) and section line 525 (south city boundary).

The area includes commercial developments between Highway 21/15 and Southfort Drive, which are mostly developed; the remaining lots (approximately 7.0ha [17 acres]) are being developed and will be completed in the near future.

The existing to date developed dwelling unit numbers in Southfort were based on 2013 census data and are presented in Table 3.1.

Table 3.1: Existing Residential Units

|  | Existing Number of Units <br> $(\mathbf{2 0 1 3 )}$ |
| :--- | :---: |
| Low Density Residential | 1045 |
| Medium Density Residential | 210 |
| High Density Residential | 195 |
|  | Total |

The number of dwelling units (DU) for full buildout of Southfort was estimated based on existing and future preliminary development plans using the lot counts. The areas where plans were not yet available and for the high density development, the following assumptions were used to estimate number of dwelling units:

- Low Density Residential (LD) - 28 DU/hectare
- Medium Density Residential (MD) - 35 DU/hectare
- High Density (HD) - 55 DU/hectare

Estimated total number of dwelling units based on full development of Southfort area is summarized in Table 3.2.

Table 3.2: Full Development Residential Units

|  | Number of Units <br> @ Full Development |
| :--- | :---: |
| Low Density Residential | 5210 |
| Medium Density Residential | 730 |
| High Density Residential | 630 |
|  | Total |

Additional developments indicated on the Southfort ASP include five potential school sites. For the purpose of this traffic assessment, one school was included with an assumed 600 students.

### 3.2 Growth Trends and Analysis Horizon

There are two residential areas developing concurrently in the City of Fort Saskatchewan. These areas include the Southfort and Westpark areas. Based on historical development intensity and local contractors' workforce potential, it is assumed that approximately 500 residential lots could be developed in one year. Futher, it is assumed that half of these lots would be developed in Westpark and the other half in Southfort. It is estimated that Westpark would be fully developed within 6 years and then the full development effort will be directed into Southfort.

Based on the above assumptions it is estimated that $50 \%$ development level of Southfort could occur within 10 years and the area could be fully developed in 15 years. Exhibit 3.1 illustrates the land use at full development of Southfort. Existing Southfort development trends indicate that areas along Southfort Drive and 94 Street (north) would be developed first. The 50\% development level is illustrated in Exhibit 3.2, indicating that southeast area of Southfort will be developed last.

The two future horizons were established for this study are:

1. Full development of the Southfort Area with possible timeline - 15 years
2. $50 \%$ development level with estimated possible timeline -10 years

## $3.3 \quad$ Background Traffic

Alberta Transportation's Regional Transportation Traffic Model for 2044 includes the City of Fort Saskatchewan with the main road network. The model inputs include future industrial developments in the north part of the City and developments north of the City in addition to the residential areas such as Southfort and Westpark.

The future model traffic estimates indicate Highway 21 and Highway 15 volumes lower than existing (2012) volumes, which suggests that external to the City through traffic will not grow, especially if another higher speed road corridor is provided, such as new river crossing south of the City.

It is assumed that future Highway 21 and Highway 15 growth will be the result of pending development in the City.

### 3.4 Transportation Study Methodology and Assumptions

A traditional four step traffic model was used to estimate future traffic volumes on the road network. Requirements for transportation infrastructure, which includes road laning and intersection control requirements, were developed based on the model.

The model includes following steps:

1. Trip Generation - estimates of number of trips generated within each land use
2. Trip Distribution - determination of origin and destination of the trips
3. Modal Split - vehicles, transit and other transportation modes' share of the trip generation
4. Trip Assignment - assumption of which roads would be used to execute the trips

PTV Vistro modelling software was used to estimate traffic on the road links and the turning movements at intersections. The estimated future traffic was analyzed using Synchro 9 software, in which the Highway Capacity Manual (HCM) methodology was utilized. The analysis determined Level of Service (LOS) which

## CITY OF FORT SASKATCHEWAN SOUTHFORT TRANSPORTATION STUDY

## LAND USE MAP

AT 50\% DEVELOPMENT OF SOUTHFORT
is based on average vehicle delay. In addition, Volume to Capacity ( $\mathrm{v} / \mathrm{c}$ ) ratios and queues at intersections were determined to indicate effectiveness of the transportation system.

Future traffic within the area and at external intersections was estimated by adding new trips generated by new developments to the existing traffic.

### 3.4.1 Zone Structure

The Southfort area was divided into homogeneous zones, representing specific land uses (residential, commercial, etc.) for which trips were estimated. Exhibit 3.3 shows the zone map developed for the model. The zones included existing developments as well as future ones. All Southfort zones are considered internal.

The external zones are accessible via entry/exit points identified in Exhibit 3.3, and are often referred to as gates.

The gates are located outside the Southfort area and treat other city locations such as Westpark, Pine View, Sherridon, and East Gate Business Park as external zones. Other external zones include the City of Edmonton, Strathcona County, and Sturgeon County - all which are accessible via Highway 21, Highway 15, and various Township and Range Roads.

Two additional zones were added to the structure to account for the Westpark development and a possible commercial development west of Highway 21 between 84 Street and Highway 15, which would impact Highway 21 traffic.

### 3.4.2 Trip Generation

Trip generation was assigned to the different housing types, school, and commercial development. Residential, school and commercial trip generation rates used in the traffic estimation are based on studies conducted locally by the City of Edmonton and the Institute of Transportation Engineers (ITE). Appendix B includes a summary of trip generation rates and fitted curve formulas for the lane uses in the model.

The Trip Generation Rates and Directional Splits are presented in Table 3.3:
Table 3.3: Trip Generation Rates and Directional Splits

| Land Use | Land Use |  | Trip Generation Rates |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## CITY OF FORT SASKATCHEWAN SOUTHFORT TRANSPORTATION STUDY ZONE MAP OF SOUTHFORT

Al-Terra

A summary of trips generated within the Southfort Area, excluding existing developments, is presented in Table 3.4.

Table 3.4: Summary of New Trips Generated in Southfort

| Land Use | Size | Units | Trips Generated |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | AM Peak | In | Out | PM Peak | In | Out |
| Low Density Residential | 4,042 | DU | 2,789 | 530 | 2,259 | 3,193 | 2,139 | 1,054 |
| Medium Density Residential | 518 | DU | 238 | 50 | 188 | 300 | 195 | 105 |
| High Density Residential | 405 | DU | 138 | 23 | 114 | 162 | 102 | 60 |
| School | 900 | students | 72 | 40 | 32 | 45 | 22 | 23 |
| Commercial Areas Combined | 727 | 1,000 sq.f.t. | 1,416 | 836 | 580 | 4,271 | 2,100 | 2,172 |

For the purpose of this study the residential trip generation has been reduced by $7 \%$ to reflect anticipated use of transit, ride sharing, walking, cycling, and work at home as an alternative to using a vehicle.

### 3.4.3 Trip Distribution and Assignment

Residential vehicle trips to and from the Southfort area were distributed assuming $93 \%$ and $90 \%$ of trips would be between an external and internal zone during the am and pm peak, respectively. The remaining residential trips would be internal trips.

The trip distribution origin and destination for the study area uses the regional traffic model developed by Alberta Transportation. The model includes inputs pertaining to trip production and trip attraction for traffic analysis zones in the Edmonton region including the City of Fort Saskatchewan.

A detailed review of the regional model provided the basis for determining peak hour trip distribution percentages between Southfort and the external zones in the longer term, when Southfort reaches full development.

Exhibit 3.4 presents the traffic distribution during the AM and PM Peak hours for the road network in the study area road network.

Internal trips are assumed to occur between residential and other land uses, such as residential and commercial, residential and the DOW Centennial Centre, and residential and the hospital. These trips were distributed proportionately to the size of the zone. School trips, because of the minor impact on the road network during peak hours were distributed in similar manner as residential trips.

Trip assignment has been carried out based on the shortest and fastest way between the origin and destination using available road network.

New commercial trips generated by the Southfort ASP and the commercial west of Highway 21 have been broken into two types of trips: primary and pass-by.

- Primary trips are trips solely between an origin and destination: for example between home and the commercial development. Primary trips are assumed to represent $70 \%$ of all commercial trips.
- Pass-by trips are the secondary stops that are made at the commercial development when driving from another origin to destination (for example, from work to home via the commercial site). It is assumed that $30 \%$ of trips to the commercial site(s) would be by-pass trips.

Diverted trips are a result of vehicles travelling outside of the study area (origin and destination outside the study boundary) that makes a pass-by stop within the study area. No diverted trips were assumed for the study because these trips are accounted in the primary trip totals.

### 3.4.4 Design Traffic Volumes

Traffic volumes for full development of the Southfort areas, which represent combined existing and development traffic, are presented in Exhibit 3.5 (AM peak) and Exhibit 3.6 (PM peak).

The road network and the design traffic volumes at $50 \%$ development of the Southfort ASP are presented in Exhibit 3.7 (AM peak) and Exhibit 3.8 (PM Peak).

### 3.4.5 Daily Volumes

Review of the existing AM and PM peak volumes and their proportion at various locations in the city indicates that AM peak represents about 8\% and the PM peak represents about 10\% of the daily volumes.

It was assumed that future traffic patterns will remain similar and the above percentages were used to estimate daily traffic volumes for the both the full development and the $50 \%$ development scenarios.

Estimated future traffic volumes in the Southfort area are presented in Exhibit 3.9 (full development) and Exhibit 3.10 (50\% development).

Based on the daily traffic volume estimates, not all the roads identified as arterials in the ASP reach traffic volumes expected for arterial roadways ( $5,000-20,000 \mathrm{vpd}$ ) where the major function is traffic mobility. Roads with lower volumes may be accommodated with a collector road standard (less than $8,000 \mathrm{vpd}$ ) where mobility and access to adjacent residential areas is of equal importance.

Collector roadways could be accommodated with a two lane undivided road within the standard collector right-of-way. Traffic control at intersections was determined based on the projected traffic during peak hours.

CITY OF FORT SASKATCHEWAN SOUTHFORT TRANSPORTATION STUDY ROAD NETWORK - ESTIMATED DAILY VOLUMES AT 50\% DEVELOPMENT OF SOUTHFORT

### 4.0 Transportation Assessment

### 4.1 Capacity Analysis

Using projected traffic, operations within the road network during AM and PM peak were determined using Synchro Studio 9 and Sidra 6.1 software suites. Level of Service (LOS) at intersections in the Southfort road network were determined using 2000 and 2010 Highway Capacity Manual (HCM) methods. The software determines the LOS, which is defined by the HCM as average vehicle delay at an intersection. In addition, volume to capacity ratio ( $\mathrm{v} / \mathrm{c}$ ) and the length of the queues were determined, which provided information used during intersection and turning lanes design.

The objective of the traffic operations at intersections is to provide an acceptable LOS which in the long term is considered:

- LOS D - delays less than 55 sec./veh. at signalized intersections and less than 35 sec./veh. at unsignalized intersections
- $\mathrm{v} / \mathrm{c}$ less than 0.9

The intersection operations were analyzed utilizing the following inputs for the signalized intersections:

- Ideal saturation flow: 1850 veh./hr./In.
- Peak Hour Factor (PHF):
- 1.0, at all Highway 21 and Highway 15 intersections where conditions approach saturation,
- 0.92 (default), for the internal intersections
- $5 \%$ heavy vehicles
- 5 pedestrian calls/hr.
- Actuated pedestrian phase provided for all approaches

All Southfort internal and external intersections were modelled during peak hours and at the two future horizons. Major intersections at Highway 21/Highway 15 and the Southfort Drive corridors were modeled in detail and the results are included in this report. The internal intersections with low and moderate traffic volumes can operate satisfactorily with unsignalized controls.

In addition, existing non-signalized major intersections on Southfort Drive and other internal intersections were analyzed using the Transportation Association of Canada (TAC) signals warrant procedure. The analyses take into consideration intersection lanes, geometry, spacing to upstream signalized intersections, traffic volumes, traffic composition, main roadway speed, pedestrian presence, bus routes, demographics in the area, and size of the community. The analyses produce a score, which if higher than 100, indicates that significant controls such as signals or a roundabout are likely required to provide satisfactory operations. Signal Warrants worksheets are included in Appendix D.

The following signalized intersections require some improvements to satisfactorily accommodate the future traffic:

- Highway 21 - Wilshire Blvd./Southridge Blvd.
- Highway 21 - Westpark Blvd./Southfort Blvd.
- Highway 21-84 Street
- Highway 21 - Commercial Access west, south of Highway 15
- Highway 21/ Highway 15 - Highway 15/94 Street
- Highway 15-101 Street
- 88 Avenue - 101 Street
- 86 Avenue - 101 Street
- 86 Avenue/Southfort Blvd. - 94 Street
- 94 Street - 87 Avenue
- Southfort Drive - Allard Way
- Southfort Drive - Greenview Way North
- Southfort Drive - 84 Street
- Southridge Blvd. - Ridge Point Gate

In addition, warrant analyses were completed for intersections at:

- 94 Street - South Pointe/Hospital Access
- 84 Street - DOW Centre Access
- Southfort Drive - Greenview Way South
- Southfort Drive - Southfort Boulevard
- Southridge Blvd. - Southfort Drive

### 4.1.1 Southfort Full Development

Initially, the traffic was assigned to Highway 21 south, utilizing existing Highway 21 intersections. This resulted in the Highway 21 and Southridge Boulevard intersection failing during the AM peak due to excessive left turning volumes ( $>850 \mathrm{vph}$ ) in addition to other traffic at the intersection. Based on this preliminary analysis, an additional Highway 21 connection was proposed, which would be used by traffic originating in southeast area of Southfort. The connection to Highway 21 would be provided at an intersection located south of Southridge Boulevard, possibly in conjunction with possible developments along Highway 21 and south of the existing city boundary. Exhibits 3.5 and 3.6 illustrate traffic for which the additional connection to Highway 21 would be provided to assure that the proposed roadway system provides acceptable traffic operations at full development of the Southfort ASP.

The following tables summarize the AM and PM peak hour capacity analysis results for the above noted signalized intersections.

Note the makings in the following tables:

- $m$ - Volume for $95^{\text {th }}$ percentile queues is metered by upstream signal
- \#-95 ${ }^{\text {th }}$ percentile volume exceeds capacity, queue may be longer
- Phases:
- Prot - Protected
- Pm+pt - Permissive and protected
- Perm - Permissive
- Pm+ov - Permissive and Right Turn Overlap

Detailed Synchro Reports are included in Appendix C.

Table 4.1 presents the intersection analysis for Highway 21 at Wilshire Blvd/Southridge Blvd. It is assumed that Highway 21 would be improved to six lanes with double left turn lanes for north and southbound approaches. The Wilshire Boulevard and Southridge Boulevard approaches configuration would provide adequate operations in the long term.

The improved intersection would operate at marginally acceptable LOS, which for the whole intersection would provide LOS D and C during AM and PM peak hours with some movements operating at LOS E. The results indicate $\mathrm{v} / \mathrm{c}$ values within the set objective of less than 0.9.

Table 4.3 presents the intersection analysis for Highway 21 at 84 Street. The highest Highway 21 and Highway 15 traffic volumes occur in the area adjacent to the commercial centers between 84 Street and 101 Street. The heaviest traffic occurs during the PM peak where the commercial traffic mixes with commuter traffic to create high volume demands. The intersections suffer significant congestion even with Highway 21 and Highway 15 upgraded to 6 lanes.

To provide additional capacity it is proposed to provide 2 through lanes eastbound and westbound at 84 Street approaches (there is currently one lane on each approach).

Assuming that the intersection would be improved, the overall operations in the long term would be acceptable even though some of the movements would operate at LOS E.

Table 4.4 presents the intersection analysis for Highway 21 at the Future Commercial Access. This alldirection intersection to the future commercial area located both west and east of Highway 21, south of Highway 15 , should operate satisfactory in the long term. Highway 21 requires widening to a 6 basic lane cross-section and additional auxiliary lanes are required to accommodate turning commercial traffic.

Table 4.5 presents the intersection analysis for Highway 21/Highway 15 at Highway 15/94 Street. Based on the estimated long term traffic, this intersection will experience congestion. The overall intersection delay is acceptable, operating at a LOS D during AM and PM peaks, and v/c values for all movements are less than 1. Some of the movements show LOS E (delay 55-80 sec./veh), and the westbound left turn operates at a LOS F (delay > $80 \mathrm{sec} . / v e h$.). Similar to intersections to the south, Highway 21 requires improvements to a 6 lane cross-section with double left turn lanes for all four approaches.

There is no further widening considered due to physical constraints of Highway 15 to the west.

Table 4.6 presents the intersection analysis for Highway 15 at 101 Street. This intersection will operate satisfactory in the long term providing that the Highway 15 is upgraded to 6 lanes and double left turn lanes are provided as indicated in the table above.

Table 4.7 presents the intersection analysis for 88 Avenue at 101 Street. This existing unsignalized intersection will require signals in the future. The TAC warrant indicates a score of 138, further confirming the capacity analysis. The intersection configuration currently constructed, with signals added, would provide good LOS in the long term.

Table 4.9 presents the intersection analysis for 86 Avenue/Southfort Drive at 94 Street. The existing signalized intersection will operate satisfactorily in the long term horizon.

It is assumed that Southfort Drive, currently 2 lane roadway south of 94 Street, will be widened to 4 lanes progressively with the increasing traffic due to development within the Southfort area.

Table 4.10 presents the intersection analysis for 87 Avenue at 94 Street. This intersection provides access to commercial areas north and south of 94 Street. This intersection will fail with its current unsignalized configuration. Signals will be required at this intersection, which result in acceptable levels of service and $\mathrm{v} / \mathrm{c}$ ratios.

Table 4.11 presents the intersection analysis for Southfort Drive at Allard Way. The existing Southfort Drive and Allard Way intersection will require signal control to accommodate future traffic. The TAC signal warrant indicates score of 195 in the long term. The intersection is currently constructed to first stage configuration with single through/right and left turn lanes on Southfort Drive would experience significant congestion under long term traffic demand, even if signalized. To provide adequate operation it is assumed that by full development of the Southfort area, Southfort Drive will be already upgraded to 4 lanes; analysis of operations under these conditions are summarized in the above table.

Table 4.12 presents the intersection analysis for Southfort Drive at Greenview Way North. This intersection will require signals, and Southfort Drive will require widening to 4 lanes to accommodate the long term traffic. The TAC signal warrant score indicates value 141. As shown in the table above, the upgraded intersection will provide very good level of service at full development of the Southfort area.

Table 4.13 presents the intersection analysis for Southfort Drive at 84 Street. Signals will be required at this intersection in the long term. With the existing two lanes on Southfort Drive, the TAC signal warrant score is expected to be 140 with long term traffic volumes; with a future four lane cross-section on Southfort Drive, the TAC signal warrant score is 126 with long term traffic.

The results presented in the above table show the intersection analyzed with signal control utilizing a possible first stage intersection configuration, which includes a single lane northbound and southbound through movements and turning lanes for the three approaches.

South of 84 Street, Southfort Drive traffic volumes drop significantly and could be accommodated with a two lane roadway in the long term rather than four lanes which will be required north of 84 Street.

When the existing unsignalized intersection operates at poor service levels, two options should be considered: signal control or a roundabout. Roundabouts, especially singe lane, are considered superior to signals. They are safer for vehicles, cyclist, and pedestrians; they are easy to navigate and provide better operation for all movements during off peak hours when the vehicles do not need to stop at the intersection.

Roundabouts are safer than comparable signalized intersections in part because the roundabout geometry acts as calming feature and significantly reduces severity of collisions.

Table 4.14 presents the intersection analysis for Southfort Drive at Greenfield Way South. The existing Southfort Drive is currently a two lane road with turning lanes at the Greenfield Way intersection. Greenfield Way is also a two lane roadway and at the approach to Southfort Drive has one shared lane to accommodate left and right turning movement.

The existing intersection in the long term does not warrant signals with a TAC warrant score of 95 but the Greenfield approach would experience long delays especially during pm peak. The delays may be reduced with an additional lane provided to separately accommodate the right and left turn movements.

The analysis in the above table show results assuming that right and left turn lanes are provided, and indicate that intersection would operate satisfactorily in the long term. The delays experienced by left turning vehicles would likely result in drivers choosing either a right turn at the intersection to travel to the south via 84 Street or use the nearby signalized intersection at Greenfield Way North.

| Intersection Average Delay(s) |  |  | 5.7 |  |  |  | Intersection LOS |  |  |  | A |  |

Table 4.15 presents the intersection analysis for Southfort Drive at Southridge Boulevard. The TAC signal warrant analysis indicates that intersection does not require signals in the long term (score of 57), assuming an undivided 2 lane standard of approaching roads. The analysis shows that turn lanes are required and some movements operate at LOS C and D.

An alternative intersection control, a roundabout, was also considered at this location. Table 4.16 presents the intersection analysis for Southfort Drive at Southridge Boulevard with a roundabout control.

Table 4.16 - Southfort Drive \& Southridge Boulevard Intersection Analysis (Roundabout)

## Southfort Drive and Southridge Boulevard

Both intersection controls provide very good traffic operations. The roundabout control would require fewer approach lanes to the intersection, and provides a more consistent level of service for all approaches.

The internal roadways south and east of Southfort Drive were analyzed assuming two lane roadways (collector standard) with widening at the intersections to provide left turning lanes. The analysis indicate that the LOS at the intersections during AM and PM peaks are LOS A or B (average delays less than 15 sec./veh.). Some selected left turn movements from minor roads would operate at LOS D (average delays no more than 35 sec./veh.), which is considered acceptable in the long term. None of the internal intersections reach the warrant for signals.

### 4.1.2 Southfort 50\% Development Level

For the scenario with $50 \%$ development of the Southfort ASP, Highway 21 and Highway 15 intersections initially were analyzed assuming the existing four lane roadway. The analysis indicated that the intersections providing access to the Southfort area would fail during peak hours with only four lanes on the highway. Therefore, all analysis relating to the $50 \%$ Southfort development scenario assumes six through lanes on the Highway 15 and Highway 21 corridor adjacent to the Southfort area.

Table 4.22 presents the intersection analysis for Highway 15 at 101 Street at 50\% Southfort development. This intersection will operate satisfactorily within the $50 \%$ development level horizon.

Traffic estimates at the $50 \%$ development level indicate volumes that are lower than at the full development level, so intersections along Southfort Drive should operate satisfactory. The improvement implementation would be dependent on actual development progress within the Southfort area.

### 4.2 Road Standards

The projected daily traffic volumes are illustrated in Exhibits 3.9 (full development) and Exhibit 3.10 (50\% development).

The land use concept for the Southfort ASP indicates Southridge Boulevard, Southfort Boulevard, 84 Street, 94 Street, and Southfort Drive with arterial standard road designation and typical four lane crosssections.

Typically, roads with volumes less than 8,000 vehicle per day in residential areas may be accommodated with a collector roadway standard. Based on the traffic estimates, not all the roads designated as arterials in the ASP reach arterial roadway volumes. This applies to 94 Street, south of the Sienna neighborhood and the Southridge Boulevard extension east of Southfort Drive.

It is proposed to designate these roadways as collectors, with road width of 11.5 m (lip to lip of gutter) with widening at intersections to accommodate turning movements as appropriate.

It is estimated that the south section of the Southfort Drive, south of Southfort Boulevard, will experience daily volumes around 4,000 vehicles at full Southfort development. This section could be accommodated with a two lane roadway (the arterial four lane road is not required). However, the first stage of Southfort Drive (two lanes of the ultimate four lanes) were constructed in 2015. Considering that the first two lanes are considered a temporary measure, the City may wish to have Southfort Drive a four-lane arterial for its entire length for consistency along the corridor.

Southfort Drive terminates at Southridge Boulevard and the south leg of the intersection will provide access to high density development.

As was indicated, there would be a capacity constraint at the Highway 21 and Southridge Boulevard intersection at full development of Southfort. This necessitates an additional connection to Highway 21 to the south. The connection is shown on the exhibits, for which a location is approximate and should be determined in conjunction with development plans for the area south of Southfort. Based on the current traffic assessment the connection to the south could be accommodated with a collector road standard.

### 4.2.1 Collector Road Cross-Section

Sections of 94 Street and Southridge Boulevard which are to be constructed using collector standard are 11.5 m wide and due to a lack of active or passive traffic calming, these roads may inadvertently encourage speeding - especially that there are no front facing lots and no demand for parking along these corridors. A cross-section illustrated in Exhibit 3.11 that shows elements that can be implemented within the paved width which would include two opposing 3.2 m wide travel lanes separated with a 1.0 m wide median. The remaining width on both sides would be designated to cyclists. The 1.8 m wide cycling lane would have a 0.5 m wide buffer (two parallel lines on pavement) to provide extra protection to cyclists. This cross-section would visually narrow the roadway and influence the drivers to travel at slower speeds, while providing buffered cycling lanes. The proposed cross-section typical complete-street (multi-modal) oriented context sensitive street design, which is very appropriate in residential and parks area.

### 4.3 Intersection Treatment Options

Traffic and signal warrant analysis indicate which intersections in the Southfort area would require upgraded intersection control. The Southfort Drive intersections at 84 Street, Southfort Boulevard, and Southridge Boulevard will operate satisfactory during peak hours with a stop control at full development of the Southfort area. The stop controlled movements will experience acceptable (less than $35 \mathrm{sec} . / \mathrm{veh}$.$) -$ LOS D delays. However, if there are public complaints regarding delays at these intersections, a roundabout option should be considered to improve these intersections (rather than unwarranted signals).

Estimated traffic at the above noted intersections can be well accommodated with single lane roundabouts. The roundabouts would provide superior operation for all movements. Roundabouts operate at slower speeds, provide traffic calming for the road network, and are safer than stop controlled or signalized intersections.

If a number of roundabouts were introduced in the Southfort area, the overall network would be safer for all users - drivers, cyclists, and pedestrians - because drivers would have to slow down to negotiate the geometry at the intersections.

Al-Terra

* bike Lane buffer

| FORT SASKATĆㅜ́ | CITY OF FORT SASKATCHEWAN <br> SOUTHFORT TRANSPORATION STUDY PROPOSED COLLECTOR TYPICAL CROSS-SECTON <br> N.T.S. <br> DATE: AUGUST, 2015 <br> EXHIBIT 3.11 |  |  |
| :---: | :---: | :---: | :---: |

Benefits of roundabouts as compared to traffic signals or stop control:

- Improves traffic flow and safety
- Traffic moves through intersection at reduced speeds
- There are fewer conflicts points between vehicles and pedestrians
- Reduces or eliminates head-on high speed and right angle collisions
- Vehicles are not forced to stop, so traffic flows continuously
- Improves the character of the roadway

Benefits of Roundabouts versus Traffic Signals:

- Potentially roadway right-of-way width may be reduced due to narrower median and fewer approach lanes
- Lower operational and maintenance costs
- Continues to function normally if damaged or during a power failure
- Signalization will not be required in long term
- Cost of construction is similar

Research indicates that due to a reduction in operating speed and conflicts, roundabouts are safer as compared to signals and stop control and experience a:

- $90 \%$ reduction in fatalities
- $75 \%$ reduction in injuries
- $37 \%$ reduction in total number of collisions
- $40 \%$ reduction in pedestrian collisions

The above safety statistics are based on "Safety Effect of Roundabout Conversions in the United States: Empirical Bayes Observational Before-After Study." Transportation Research Record No. 1751, Transportation Research Board, National Academy of Sciences (NAS), Washington, D.C. 2001.

Exhibit 3.12 indicates the proposed road network and intersection traffic controls at full development of the Southfort area. Existing and future signals shown on the exhibit are required based on traffic demand. Locations of potential and recommended roundabout locations are also shown on map.

Roundabout intersections are good solutions for the Southfort area because the main roads, which include 94 Street and Southridge Boulevard, are adjacent to residential developments and parks. The roundabouts would promote slower speeds and would create friendlier environment for pedestrians and cyclists. The roundabouts will accommodate long term traffic for all movements without the need for signals and vehicles would experience less delays than at signals.

The proposed roundabouts would be designed to slow down traffic so the approaching and circulating traffic speeds are similar. The central island would have an apron to accommodate large trucks. The geometry of roundabout would accommodate cars, transit, school busses, and fire trucks within the paved roadway without using the apron.

The proposed roundabouts would be single lane roundabouts with outside diameter 40-45m. The circulating speed of the roundabout would be approximately $30 \mathrm{~km} / \mathrm{h}$ and have similar entrance and exit speeds. The low speeds and the geometry make the roundabouts safer and easy to navigate. The

roundabouts would have splitter islands on the approaches which would provide safe and easy pedestrian crossing.

Based on the foregoing traffic projections and analysis, during further development of the Southfort area and road construction, the roundabout intersection control is proposed to provide a friendly and lower speed environment for all users in this residential neighborhood.

Some roundabouts identified on Southfort Drive in Exhibit 3.12 are shown as potential. The signal warrants are not met for those intersections but minor movements may experience somewhat longer delays, which may be perceived as unacceptable by local residences. In this case roundabout control should be an option considered rather than signals.

### 4.4 Public Transportation and Pedestrian/Cyclist Network

### 4.4.1 Public Transportation

Currently public transportation doesn't have any significant share of the travel market in the City of Fort Saskatchewan. If in the future there is a demand for public transportation in the Southfort ASP, the City should review the arterial, collector, and a walkway/multi-use trail system to provide a desired maximum 400 m walking distance between any residence and a potential bus stop located on collector or arterial roadways.

### 4.4.2 Pedestrian/Cyclist Network

Active transportation is considered a high priority and effective pedestrian linkages between residential, commercial and institutional area are considered essential. Based on the Southfort ASP, a series of multiuse trail linkages along the highway corridor and through greenbelts connects the Southfort area with surrounding communities. The Recreational, Culture, and Parks Facilities Master Plan defines regional, primary, and secondary trails and should be used as a guide in further development of the Southfort area to provide an active transportation network.

If the proposed collector cross-section is adopted, the trail system should incorporate the proposed bike lanes into the system.

### 5.0 Conclusions and Recommendations

Based on the analysis described, we have concluded the following:

1. Highway 21 and Highway 15 will require widening to 6 basic lanes within the $50 \%$ development level horizon to provide satisfactory operations at intersections which provide access to Southfort area. Traffic volumes and operations at the intersections should be monitored to ensure optimal timing of improvements.
2. The Southfort Drive arterial roadway should terminate at Southridge Boulevard.
3. With full development of the Southfort ASP, an additional connection to Highway 21, south of Southridge Boulevard will be required to accommodate traffic travelling to/from Edmonton and Strathcona via Highway 21. The location and the alignment of the Highway 21 connection should be incorporated into development plans for the area south of Southfort.
4. Southfort Drive will require four lanes from Southfort Boulevard to 94 Street to accommodate 50\% development and full development levels.
5. Not all the roads designated as arterials in the ASP reach arterial roadway volumes, therefore it is proposed to construct collector standard roadway on 94 Street south of the Sienna neighbourhood, and Southridge Boulevard east of Southfort Drive, rather than a conventional divided arterial.
A context sensitive cross-section is suggested to influence speeds on those roads, while providing buffered bike lanes and encouraging active transportation in the area.
6. To build on the multi-modal alternative approach, a number of single lane roundabouts are proposed which will provide superior traffic control at the intersections as well as act as traffic calming feature desired in residential and parks environments.
7. The Southfort Drive intersections at Southfort Boulevard and Southridge Boulevard do not reach the warrant for signals but may experience somewhat longer delays for minor turning movements. The intersections could be converted to single lane roundabouts to provide continuous flow, as well as safer operations for all movements and users.

## Appendix B

Trip Generations Rates<br>Used in Edmonton Capital Regions

## 2013 RECOMMENDED TRIP GENERATION RATES <br> RESIDENTIAL LAND USES

| Land Use | Time Period | Rate | In/ Out Split | Notes |
| :---: | :---: | :---: | :---: | :---: |
| Low Density Residential | AM Peak Hour | 0.69 trips/ du | 19\% 81\% | Measured |
|  | PM Peak Hour | 0.79 trips/ du | 67\% 33\% | Measured |
|  | Daily | 7.92 trips/ du | 50\% 50\% | Measured |
| RF5 - Row Housing | AM Peak Hour | 0.46 trips/ du | 21\% 79\% | ITE LUC 221 |
|  | PM Peak Hour | 0.58 trips/ du | 65\% 35\% | ITE LUC 221 |
|  | Daily | 6.59 trips/ du | 50\% 50\% | ITE LUC 221 |
| RA7 \& RA8 - Apartment Housing | AM Peak Hour | 0.34 trips/ du | 17\% 83\% | Measured |
|  | PM Peak Hour | 0.40 trips/ du | 63\% 37\% | Measured |
|  | Daily | 5.81 trips/ du | 50\% 50\% | ITE LUC 230 |
| Non- specific Medium Density Residential | AM Peak Hour | 0.44 trips/ du | 17\% 83\% | ITE LUC 230 |
|  | PM Peak Hour | 0.62 trips/ du | 65\% 35\% | ITE LUC 220 |
|  | Daily | 5.81 trips/ du | 50\% 50\% | ITE LUC 230 |

The low density residential rates summarized above should be used as base rates, which may be adjusted to better reflect the specific scenario being analyzed including the potential changes in traffic generation during the life cycle of neighbourhoods and potential changes in private vehicle usage with global improvements to transit and active modes infrastructure.

## Intersection Summary

## Area Type: Other

Cycle Length: 140
Actuated Cycle Length: 140
Offset: 80 (57\%), Referenced to phase 2:NBT and 6:SBT, Start of Green
Natural Cycle: 110
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.78
Intersection Signal Delay: 26.4 Intersection LOS: C
Intersection Capacity Utilization 69.7\% ICU Level of Service C
Analysis Period (min) 15
\# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
$m$ Volume for 95 th percentile queue is metered by upstream signal.
Splits and Phases: 107: Highway 21 \& Wilshire Blvd./Southridge Blvd.

## Intersection Summary

Area Type: Other

Cycle Length: 140
Actuated Cycle Length: 132
Natural Cycle: 105
Control Type: Semi Act-Uncoord
Maximum v/c Ratio: 0.86
Intersection Signal Delay: 31.4
Intersection Capacity Utilization 90.3\%
Intersection LOS: C
ICU Level of Service E
Analysis Period (min) 15
\# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

## Intersection Summary

## Area Type: <br> Other

Cycle Length: 140
Actuated Cycle Length: 140
Offset: 0 (0\%), Referenced to phase 2:SBTL and 6:NBT, Start of Green
Natural Cycle: 105
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.68
Intersection Signal Delay: 21.2
Intersection LOS: C
Intersection Capacity Utilization 58.0\% ICU Level of Service B
Analysis Period (min) 15
\# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
$m$ Volume for 95 th percentile queue is metered by upstream signal.
Splits and Phases: 91: Highway 21 \& Future Commercial Access

## Intersection Summary

Area Type: Other

Cycle Length: 140
Actuated Cycle Length: 140
Offset: 86 (61\%), Referenced to phase 2:SWT and 6:NET, Start of Green
Natural Cycle: 110
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.96
Intersection Signal Delay: $42.7 \quad$ Intersection LOS: D
Intersection Capacity Utilization 95.8\% ICU Level of Service F
Analysis Period (min) 15
\# 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.
$m$ Volume for 95 th percentile queue is metered by upstream signal.
Splits and Phases: $\quad$ : Highway 21 \& 94 Street \& Highway 15

## Intersection Summary

## Area Type: <br> Other

Cycle Length: 70
Actuated Cycle Length: 70
Offset: 0 (0\%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green
Natural Cycle: 50
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.76
Intersection Signal Delay: 12.4 Intersection LOS: B
Intersection Capacity Utilization 60.5\% ICU Level of Service B
Analysis Period (min) 15
Splits and Phases: 55: Allard Way \& Southfort Drive

## Intersection Summary

## Area Type: Other

Cycle Length: 70
Actuated Cycle Length: 70
Offset: 38 (54\%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green
Natural Cycle: 60
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.52
Intersection Signal Delay: 7.3
Intersection LOS: A
Intersection Capacity Utilization 68.5\% ICU Level of Service C
Analysis Period (min) 15
m Volume for 95 th percentile queue is metered by upstream signal.
Splits and Phases: 55: Allard Way \& Southfort Drive

## Intersection Summary

## Area Type: <br> Other

Cycle Length: 70
Actuated Cycle Length: 70
Offset: 0 ( $0 \%$ ), Referenced to phase 4:EBL, Start of Green
Natural Cycle: 50
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.48
Intersection Signal Delay: 12.1
Intersection LOS: B
Intersection Capacity Utilization 51.9\% ICU Level of Service A
Analysis Period (min) 15
Splits and Phases: $\quad$ 12: Southfort Drive \& 84 Street

## Intersection Summary

## Area Type: Other

Cycle Length: 140
Actuated Cycle Length: 140
Offset: 0 (0\%), Referenced to phase 2:NBT and 6:SBT, Start of Green
Natural Cycle: 100
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.88
Intersection Signal Delay: 28.3
Intersection LOS: C
Intersection Capacity Utilization 66.8\% ICU Level of Service C
Analysis Period (min) 15
~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
m Volume for 95 th percentile queue is metered by upstream signal.
Splits and Phases: 107: Highway 21 \& Wilshire Blvd./Southridge Blvd.
